

The Oceans Are the Lungs of the Earth

Half of the oxygen produced on Earth comes from the oceans.

Mud flats, marine plants, and underwater sediment absorb carbon dioxide and convert it into oxygen.

In diesel vehicles, the Diesel Particulate Filter (DPF) filters out fine dust and soot.

The filtered pollutants are then burned off.

This warning light will come on if there is a problem with the DPF.

It may also come on if you drive mostly short distances at a low speed over a prolonged period of time, as the DPF will be unable to remove pollutants properly.

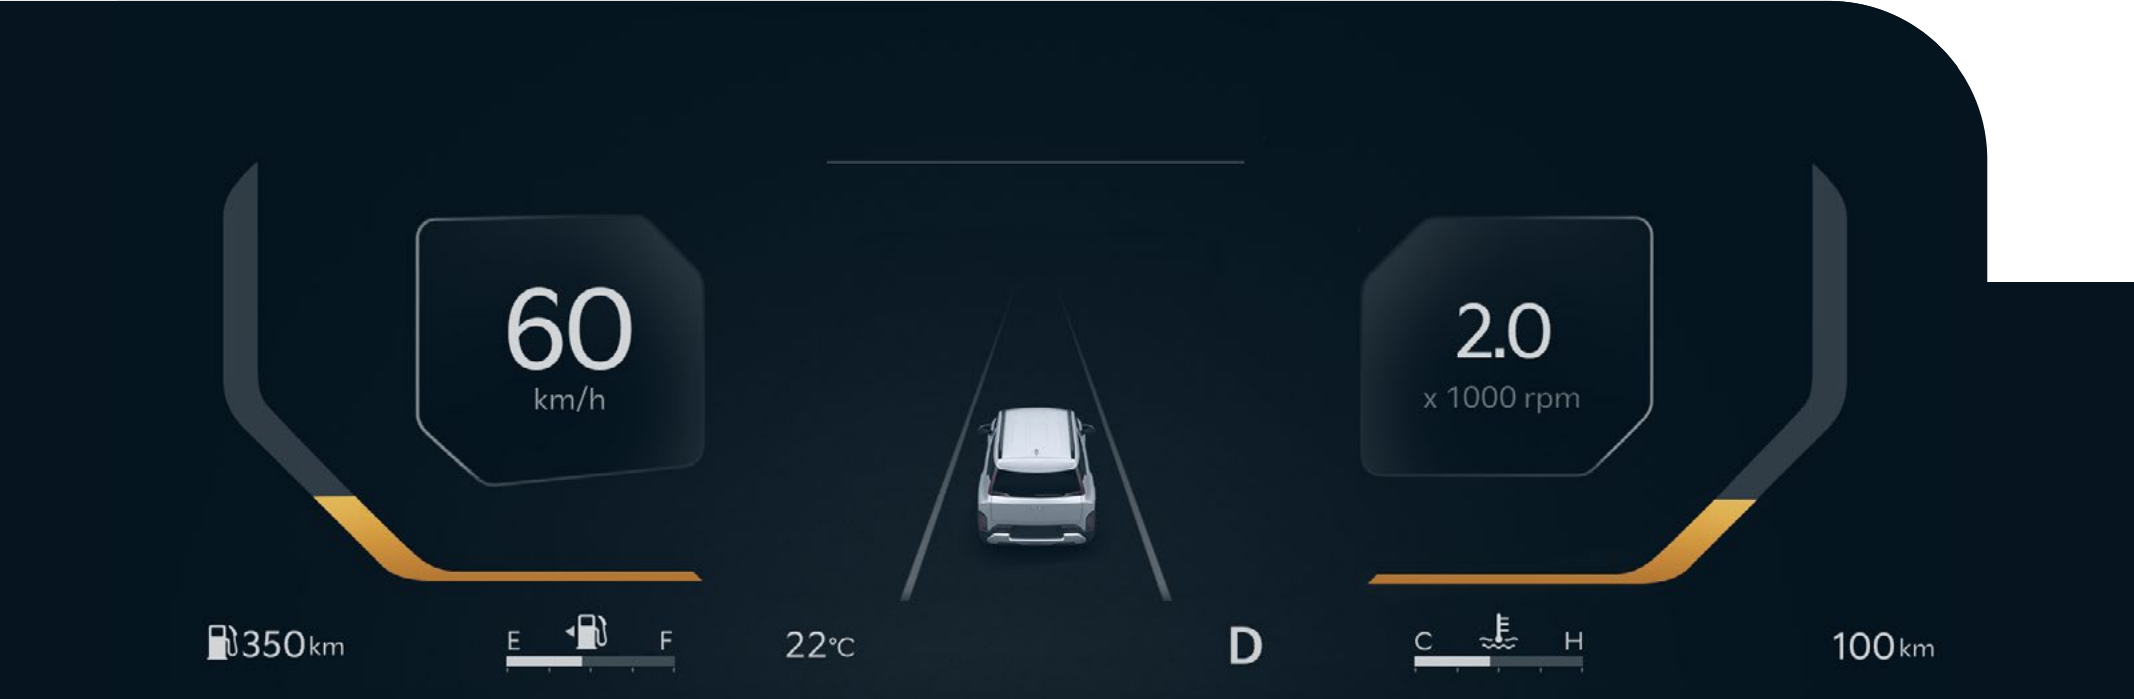

You can resolve this with “forced DPF regeneration.”

This is a combustion process that burns off accumulated pollutants at high temperatures.

Simply drive for **30 minutes** at over **60 km/h**, and around **2,000 rpm**.

The warning light should go out following forced DPF regeneration, once all the pollutants are burned off.

If it does not go out, visit an authorised Kia dealer and have your vehicle inspected.

Driving with the warning light on may damage the DPF or reduce fuel efficiency over time.

Do you drive infrequently or mostly at low speeds?

Once a month

More than 30 minutes

Over 60 km/h

Drive at over 60 km/h for more than 30 minutes at least once a month.

This will extend the life of the DPF and help maintain its performance.

The criteria and details may differ depending on the options and specifications of each individual vehicle, and may vary according to regional regulations, driving conditions, the actual condition of the vehicle, and external factors. The company shall not be held legally responsible for any injuries, damage, or other issues resulting from user negligence or improper handling while operating or inspecting the vehicle in accordance with CardNews.
